Elements is designed for non-photographers to use to fix photos in-house and for those that just want to make changes without spending an arm and a leg. Elements also comes with built-in tools to help transform images easily. Although Elements can do more than Photoshop, it focuses on helping you with everyday tasks and so it has fewer features. Elements has a section for frequently used tools, as well as a layer editor that enables the user to make specific changes to photos. Adobe PhotoShop Elements is available to download from Adobe's website at Other image-editing software Photoshop is one of the most popular editors out there, but it isn't the only one. Other popular editors include the following: Canon's Digital Photo Professional (D-PhotoPro), which comes with many of the same features as Adobe's Photoshop Elements. You can download Digital Photo Professional from the Canon website at EOS's Photo Fax Studio, which enables the creation of great prints from digital images. Using an Image-Editing Package In the following sections, we show you how to edit an image with Photoshop, Photoshop Elements, and Photoshop Elements Extended, as well as how to transform your image and save it. Revealing the layers window in Photoshop In Photoshop, you edit your images by adding layers to them — moving and changing their pixels. You can manipulate an image and create effects like those in the box just by changing pixels on each layer. Adding a background to your image If your image is already on a background, you can add another background to give your new layer a better grip on the image. Drag your canvas to your document window and choose Layer⇒Layer to add a background to your image. If you want to add a transparent or solid background, first click to select the canvas and then

Q: Is a constant projection on a contractible manifold M contractible? Suppose M is an n -manifold. Is the space of constant maps from M into a contractible manifold N (n -manifold of the same dimension) contractible?

A: Yes, because it is a product of contractible spaces and constant maps are fiber bundles, so the product of the fiber bundles is again a fiber bundle. In general, suppose M is a contractible space and N is any space. Then a map $f: M \rightarrow N$ is constant if and only if the pullback map $f^*: N \rightarrow M$ is a covering map. In this case, it is easy to see that f is surjective and injective (un)ramified over the fiber over a point. If these two properties hold, then $M \times N$ is homotopically equivalent to M ; so $\pi_0(M \times N) \cong \pi_0(M)$ and $\pi_1(M \times N) = \pi_1(N) = 0$.

Republican presidential nominee Donald Trump and his family are in mortal danger of bankruptcy if the results of the November 8 election go against them. It looks like Trump has the momentum to make it happen, but the Clinton machine is rethinking their strategy after the latest FBI revelations surfaced. Clinton campaign chairman John Podesta pointed out that the FBI is now investigating former Democratic nominee Clinton herself for the same reasons it's investigating Trump over his private phone calls. Trump supporters believe that the Clinton Foundation has been nothing but a pay-to-play scheme to enrich the Clintons through donations. This latest rumor about Hillary Clinton giving FBI Director James Comey her "plausible deniability" in regard to the contents of her emails, which would guarantee she is a free pass from a prosecution if she wins the presidency, have ruffled feathers in the Trump camp. According to Fox News, a former Clinton aide accidentally spilled the beans that Clinton is putting her personal convenience ahead of the country: On Tuesday, Fox News reported that Hillary Clinton is being advised by her lawyer to destroy her personal emails and then invoke her Fifth Amendment right to avoid indictment. According to the report, Clinton has been contacted by Attorney Marc Elias,
